Table 7 shows average profit per operation for flights characterized by stage length. Stage lengths of less than 250 miles are defined as short-haul markets, those of 250-500 miles are medium-haul, and stage-lengths greater than 500 miles are long-haul. The New York airports (La Guardia, Kennedy and Newark) are categorized separately from other short-haul markets.

Table 7 includes average profit values for airline flights other than those appearing on the CAB Form 586 DCA data collected. The estimated values for these flights are discussed below.

Estimates for Unavailable Data

Estimates of DCA passenger traffic for typical flights were developed for Air Florida (QH), Ozark (OZ), Midway (ML) and the commuter airlines certificated as air carriers by CAB. These commuter airlines are Altair (AK), Aeromech (KC), New Haven (NB), Empire(UR) and Midsouth (VL). The estimates are based on each airline's scheduled routes and its system-wide load factors and direct operating costs. Each estimate is discussed below.

Air Florida primarily serves the Washington, D.C.-Miami (MIA)/Jacksonville (JAX), Florida markets. The first arrival and last departure of the day are typically short-haul routes. In August 1979, Air Florida's short-haul routes were to and from Philadelphia (PHL). Air Florida data estimates for the Miami and Philadelphia routes are shown below, as well as the resultant estimates of average profit for each route.

Airline. Air Florida

Routes:	DCA-MIA	
	<u>DCA-JAX</u>	<u>DCA-PHL</u>

Midway Airlines is serving the Washington, D.C. - Chicago (Midway Airport, MDW) market. Data estimates, including the standard Washington-Chicago fare, are shown below.

Airline: Midway Airlines
 Routes: DCA -- MDW
 Equipment: DC-9-10
 Passengers/operation: 54
 Seats/operation: 83
 Fare: \$83.33
 Distance: 612 miles
 DOC per mile: \$3.769

Estimated profit per operation: \$2,193

Ozark's markets are Washington, D.C. - St. Louis, Mo. and Washington, D.C. - Champaign, Ill. (CMI) routes. Original estimates are based on only the DCA - CMI routes, as shown below.

Airline: Ozark
 Routes: DCA -- CMI
 Equipment: DC-9-30
 Passengers/operation: 58
 Seats/operation: 100

Fare: \$83.33
Distance: 612 miles
DOC per mile: \$3.829

Estimated profit per operation: \$2,490

Altair services the Washington, D.C. - Richmond, Va. (RIC) market.
Estimates developed for Altair are shown below.

Airline: Altair
Routes: DCA -- RIC
Equipment: Nord 262
Passengers/operation: 17
Seats/operation: 26
Fare: \$37.04
Distance: 94 miles
DOC per mile: \$2.252

Estimated profit per operation: \$418

In the third quarter of 1979, all Empire routes served the Washington, D.C. - Utica, N.Y. (UCA) markets. Estimates for Empire are shown below.

Airline: Empire
Routes: DCA -- UCA
Equipment: SWM
Passengers/operation: 11
Seats/operation: 17
Fare: \$60.19

Distance: 350 miles
DOC per mile: \$0.994

Estimated profit per operation: \$314.19

The commuter New Haven operates Washington, D.C. - New Haven, Conn. (HVN) routes. Estimates of its flight statistics are shown below.

Airline: New Haven
Routes: DCA -- HVN
Equipment: EMB
Passengers/operation: 10
Seats/operation: 17
Fare: \$60.19
Distance: 350 miles
DOC per mile: \$0.994

Estimated profit per operation: \$254

Although Aeromech has been awarded slots by the Airline Scheduling Committee in the past few allocations, the slots have not yet been used. Estimates for New Haven are used for Aeromech.

No data is available for Midsouth as yet. Midsouth is using its slots for Washington, D.C. - New Bern, N.C. (EWN) routes. Estimates developed for New Haven are used for Midsouth as well.

Minimum Service Requirements

The daily allocations by airline and market group allow constraints guaranteeing minimal service to each market group. The minimum number of DCA operations required to accommodate August 1979 passenger traffic are

calculated for a range of maximum average load factors. Minimal DCA service requirements, shown on Table 8, are tabulated by origin-destination and by the specified maximum average load factor. The calculations are based only on the DCA flights reported in the August 1979 CAB Form 586 data. On Table 8 some markets are designated as being served only by one carrier. The single carrier designations are based only on August 1979 operations, and they do not consider service by commuter carriers.

APPENDIX D

WINTER 1979 ALLOCATIONS

Appendix D consists of a series of model solutions based on the Winter 1979 DCA slot requests and the corresponding Airline Scheduling Committee allocations. The airlines originally posted the slot requests shown on Table 1. The Airline Scheduling Committee agreed to two separate allocations, one for the October 28 - December 13, 1979 time period, shown in Table 2, and a second allocation for the December 13, 1979 - April 29, 1980 time period, shown in Table 3. The Committee placed slots in time periods other than those originally requested in order to fill available capacity. For flexibility in modeling this problem, the adjusted table of slot requests shown on Table 4 was constructed. The adjusted requests show for each airline and time period either slots requested or slots actually granted, whichever is larger. The modeled hourly allocations included in this appendix use Table 4 as input.

Table 5 shows daily slot requests by airline and the market each has historically served. For some requests the market is designated as "unknown." For these no assumption concerning the use of the slots, if granted, can be drawn from analysis of historical use of slots. In this appendix the model applications which allocate daily slots by market and airline use Table 5 as input.

The cases in Appendix D include allocations by airline and time-of-day and also daily allocations by airline and market for the Winter 1979 allocation problem. In one case the daily slots allowed each airline are specified, and the model allocates these daily totals to individual time periods. In the applications the options differ by the choice of imposed constraints.

Table 6 is an index of the results of Winter 1979 sample applications. For each case and constraint option, one page shows the solution, and a second page shows resulting statistics by airline.

APPENDIX E

SUMMER 1980 ALLOCATIONS

Appendix E consists of a series of model solutions based on the Summer 1980 DCA slot requests and the corresponding Airline Scheduling Committee allocation. The airlines originally posted the slot requests shown on Table 1. The Scheduling Committee allocation, shown on Table 2, placed slots in alternative time periods to fill available capacity. Also, no posted requests are shown for Midway (ML) and Midsouth (VL), but these airlines were granted slots by the Committee. For flexibility in modeling, the adjusted table of slot requests shown on Table 3 was constructed. The adjusted requests show for each airline and time period either slots requested or slots actually granted, whichever is larger. The modeled hourly allocations included in this appendix use Table 3 as input.

Table 4 shows daily slot requests by airline and the market each has historically served. For some requests the market is designated as "unknown." For these no assumption concerning the use of the slots, if granted, can be drawn from analysis of historical use of slots. In this appendix the model applications which allocate daily slots by market and airline use Table 4 as input.

The model solutions differ by choice of imposed constraints, objective function and either the current DCA operating rules or the FAA proposed rules. Unless specified otherwise, the model maximizes industry profits. Some cases maximize passengers carried or maximize passenger-miles generated as variations of the slot allocation model developed. Most of the model applications in this appendix allocate daily slots by airline and market. Some applications spread daily slots specified for each airline by time-of-day.

Table 5 is an index of the results of Summer 1980 sample applications. For each case and constraint option, one page shows the solution, and a second page shows resulting statistics by airline.
